

Education: Yesterday, Today, and Tomorrow

With a power Point presentation, Mr. McMillan examines the early history of education in the United States from the first schools through the development of our school system.

Next, he covers the first high school in the nation and the creation of our first kindergarten.

He then goes into some detail about our poor standing among nations of the world in Math, Science, and Reading. Why do we rank so low when we are the world's leader in so many ways? What is the role of the computer in education? What about the role of vocational training? And what ever happened to cursive writing?

Finally, Mr. McMillan covers homeschooling, internet classes and questions about whether schools should now be year round in order for our children to be more competitive?
